                                                                                                                                                                                                                 9
                                              chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombior apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radiouncilde and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.
                                                                                                                                                                                                                           1 MACGGGHMAQVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLLTSRSNAQRQEI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                         to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.
                                                                                                                                                                                                                                                         The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MACGCGHMAQVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLTSRSNAQRQEI

                                                                                                                                                            The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radiounclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.
                                                                                                                                                                                                                                                                                                                                                                     1 MACGGGHMAQVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLLTSRSNAQRQEI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                         This polypeptide exhibits strong anticoagulant activities and is useful for the treatment and prevention of e.g. thrombosis or disseminated intravascular coagulation in the brain, heart and peripheral blood vessels, such as cerebral and myocardial infarction. It has no antigenicity against man and can be produced in large amts. using recombinant methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This vascular anti-coagulating protein (VAC)-alpha is used in the preparation of monoclonal antibodies (MADs). The VAC-alpha is injected into a host animal, in conjugation with eak perplet hamocyanin, and the B-cells from immunised hosts are then fused with myoloma calls. The resultant hybridomas (VAA-8 and VAA-9) produce Abs specific to VAC-alpha. Abs can be used as immunossay reagents to detect VAC proteins, as affinity ligands for protein purificm, and as medicaments for binding and/or neutralising VAC proteins in vivo. See also AAN91354 and

The proteins are bifunctional Aequorea victoria green fluorescent protein conference of the proteins are bifunctional Aequorea victoria green fluorescent proteins.

GFP)-annexin fusion proteins, where the GFP and annexin moleties provide greater or equal fluorescent intensity and anionic phospholipid binding affinity, respectively, than do the corresponding unfused GFP and annexin proteins. An early manifestation of apoptosis is the loss of the proteins. An early manifestation of apoptosis is the loss of the plasma membrane phospholipids on the extracellular leaflet of the capasure of anionic phospholipids on the extracellular leaflet of the glasma membrane. The GFP-annexin V fusion proteins are used for the detection of apoptotic cells by flow cytometry or fluorescent microscopy. The fusion proteins provide for homogeneously labelled annexin, with fluorescence properties that do not change upon binding membrane phospholipid of FIFC-annexin V fluorescence by 40-50% occurs upon binding phospholipid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an annexin polypeptide. The domain of annexin, which may be modified, is used to construct the chemical compounds of the invention. The specification describes chemical compounds which have an affinity for a phospholipid. The chemical residues supporting as test one chemical functions that are capable of binding to the phospholipid and at least partly define the affinity of the structure for the phospholipid. The compounds act as phospholipid as equesters. The compounds are useful for preparing antithrombotic, antitumor and antiinflammatory medicaments, for making coatings for thrombogenic biomaterials, and for preparing labelling compounds useful for analysing and detecting negative

derivatives or fragments. Protein kinase C (PKC) is a key enzyme in signal transduction involved in a variety of cellular functions including cell growth, regulation of gene expression and ion channel activity. The localisation of different PKC isozymes to different areas of the cell in turn appears due to binding of the activated isozymes to the specific anchoring molecules (RACKS). Peptides that minic either the PKC-binding site on PKC are isozyme specific translocation inhibiting translocation or function of deltapkC. The celtarkC agonists or inhibiting translocation or function of deltapkC, The celtarkC agonists or antagonists are useful in reducing, enhancing or protecting against damage to cells or tissues due to ischaemic or hypoxic event caused by stroke Acute administration of the peptides, conjugated to a carrier peptide or a Tat-derived peptide, protected hearts against ischaemic damage as shown by decreased release of creatine kinase. The ischaemic damage as shown by decreased release of creatine kinase. The greater than 50% protection against ischaemic damage. The presented is human annexin V, which contains a delta RACK binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                           Annexin V, which has high affinity for active thrombocytes, is used as a carrier molecule to build a thrombus-targeting thrombolytic fusion protein. The protein (this sequence) is the result of expression of a fusion gene comprising the Annexin V gene and a low-molecular urokinase gene, in insect cells. The Annexin V-scu-PA-32 fusion protein, expressed in insect cell strain Tn-5B1-4, has high affinity for active thrombocytes and has the fibrinolytic activity of urokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               247
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     520

                                                                                                                                                                                                                                                                                                                        The sequence given is the amino acid sequence of CPB-I. CPB-I was used within a method which involved adding basic amino acids to it which resulted in its stabilisation. This lead to the production of CPB-I which keeps its activity when it is frozen, molten or has been processed by several procedures.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                     indicating that PAP-I is probably not constitutively secreted.

The Met residue is removed at in a post-translational event and the newly formed NH2-terminal Ala residue is blocked by acctylation.

It binds to phospholipid and inhibits phopholipase A2.

It binds to phospholipid and inhibits phopholipase A2.

The protein can substitute heparin or other anticoagulants in the treatment of disseminated intravascular coagulation, deep vein thrombosis, or other disorders. It also has antiinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                     The invention relates to eye drops contain CPB-I (anexin V) and a polyhydric alcohol having a carbonyl value of not more than 5micro Mol./g. The eyes drops are for treating e.g. corneal diseases. Such eye drops are without unpleasant irritation upon dropping but with satisfactory long-term storage stability. The present sequence is the human CPB-I (calcium/phospholipid binding) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 AQVLRGTVTDFPGFDERADAETLRKAMKGLGTDEESILTLLTSKSNAQRQEISAAFKTLF

                                                           17. Biochem. 337:125-131(1999).

1- FUNCTION: THIS PROTEIN IS AN ANTICOAGULANT PROTEIN THAT ACTS AS AN INDIRECT INHIBITOR OF THE THROMBOPLASTIN-SPECIFIC COMPLEX, WHICH IS INVOLVED IN THE BLOOD COAGULATION CASCADE.

1- SUBBUNIT: MONOMER, BINDS ATRX (By similarity).

1- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.

1- SIMILARITY: BELONGS TO THE ANNEXIN FAMILY.

1- SIMILARITY: Contains 4 annexin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PROSITE; PS00223, ANNEXIN; 4.
